1. Read data from employee_info.csv from error handling and save the result in database table called employee_info

2. Do question number 3 of error handling but data has to be read from table instead of csv file

3. Read csv file generated from 13 of library and store data in table (create table by yourself)

4. Do question number 5 of library but word has to be stored in database instead of json file. (Manually create a table and store data in prior)
